

**SMART CONTRACT
SECURITY ANALYSIS REPORT
ON
REDKITE**

Jan 27th 2022

Security Rating

(The rating is based on the number, severity and latest status of detected issues)

Disclaimer

This report contains confidential information which can be used internally by the Customer, or it can be disclosed publicly after all vulnerabilities are fixed — upon a decision of the Customer.

SecuriChain does not provide any warranty or guarantee regarding the absolute bug-free nature of the technology analyzed.

The report in no way provide investment advice, nor should be leveraged as investment advice of any sort.

1. VULNERABILITY ASSESSMENT OVERVIEW

1.1. ASSIGNING RISK LEVELS

The Auditor categorizes each of the detected vulnerabilities into 4 levels (**High**, **Medium**, **Low**, and **Info**) according to the degree of the risks it may cause in Customer’s operations. For details of the rating standards, please refer to “Appendix 2 Risk Rating.” Please also note that the assessment of the findings is based on Auditor’s own perspective and may contain speculations in some cases.

1.2. SCOPE OF WORK

Project Name	REDKITE
Platform	ETHEREUM
Languages	SOLIDITY
Methods	AUTOMATION SCAN, ARCHITECTURE REVIEW, FUNCTIONAL TESTING, MANUAL CODE REVIEW
Repository	GITHUB: HTTPS://GITHUB.COM/POLKAFOUNDRY/REDKITE-CONTRACT COMMIT: A75BCEC
Documents	
Timelines	JAN 18TH 2022 – JAN 27TH 2022

1.3. CHECKSUM FILE

REDKITE – IDO-POOL

No.	Hash	Name
1	828d640d61774e6d72b025ae8f1842b76b0f69bfd884e73003178d84155b87a4	RedKiteWhitelist.sol

1.4. ASSESSMENT RESULTS

*According to the assessment, the Customer's smart contracts have the security rating of **99/100***

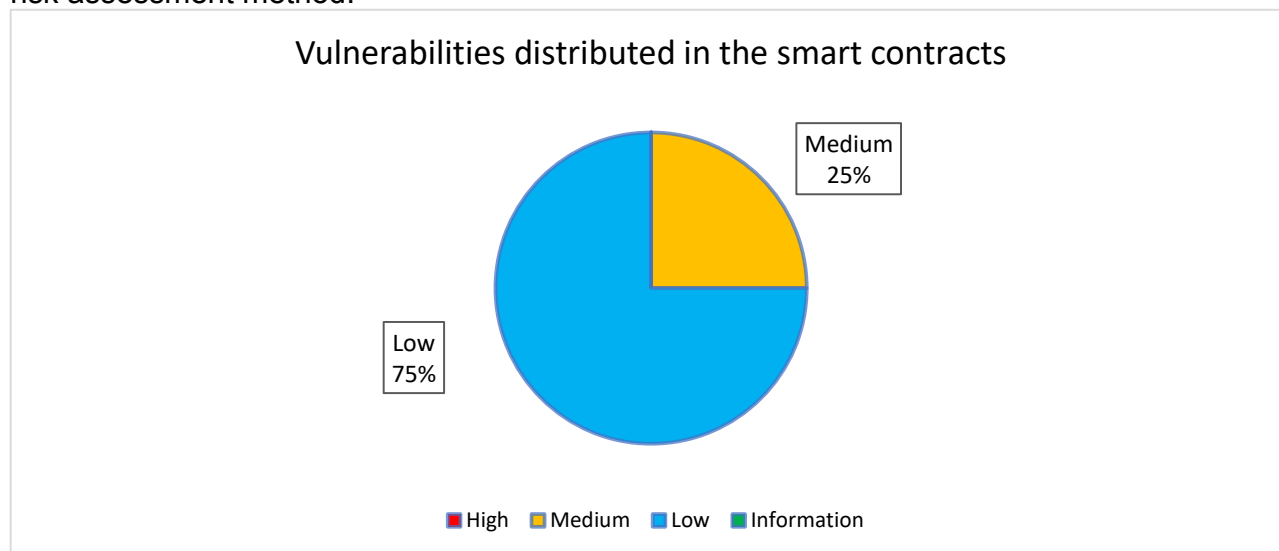

Rate	Description
90-100	No vulnerabilities were found or all detected ones have been resolved
60-89	Unresolved Low-level vulnerabilities exist
40-59	Unresolved Medium-level vulnerabilities exist
0-39	Unresolved High-level vulnerabilities exist

(For more information on criteria for risk rating, refer to Appendix.2)

2. FINDINGS

2.2. LIST OF VULNERABILITIES

The detected vulnerabilities are listed below. Please refer to "Appendix.2 Risk Rating" for the risk assessment method.

ID	Risk Level	Name	Amount	Status (after re-checking)
SC1	Medium	The allocClaimAll () function does not work as expected.	1	Resolved in commit id: 35c8aa15846df5df40c1ddf20182988633ee48c2
SC2	Low	Gas Optimization	3	Resolved in commit id: e18fa03062ef71a26f3b106cb1fd9ee7f317eb43

(For rating of each vulnerability, refer to Appendix 2.)

2.3. DETAILS

[1] Function does not work as expected.

1

MEDIUM

- **Overview**

Logic Vulnerability.

- **Description**

The function is mishandling the `for` loop. The value in the `_pids` array is not used.

```

532     /*
533     * @notice Harvest proceeds on all pools for msg.sender
534     * @param _pids ids of the pools
535     */
536     function harvestAll(uint256[] memory _pids) external {
537         uint256 length = _pids.length;
538         for (uint256 pid = 0; pid < length; ++pid) {
539             harvest(pid);
540         }
541     }

```

(Blurring the image of the code snippet in the public report because the Customer's code is in the private repository)

- **Recommendation**

Use the value in the `_pids` array which corresponds to the index instead of using the index as a parameter to pass to the subfunction

- **Location:**

- [Staking::AllocationPool.sol](#) (#L536-L541)

[2] Gas Optimization

Overview

Gas optimization is a matter of doing what is cheap and avoiding what is expensive in terms of gas costs on EVM blockchains.

Possible Impact

```

296     function _updateSupplyTokenIDtoPoolContract(
297         address _tokenFactory,
298         address _token,
299         uint256 _amount,
300         address _tokenId,
301         uint256 _poolAmount,
302         uint256 _minAmount,
303         bytes memory _signature
304     ) public {
305         require(isTokenFactory[_token].type() == 0, "IDO: INVALID_TOKEN_FACTORY");
306         require(_amount > 0, "IDO: CANNOT");
307         require(_tokenId != 0, "IDO: INVALID_TOKEN_ID");
308         require(_signature.length() > 0, "IDO: INVALID_SIGNATURE");
309
310         _updateSupplyTokenIDtoPoolContract(_tokenFactory, _amount);
311
312         uint256 tokens = _getDifferenceCurrencyToTokenAmount(tokens, _amount);
313         require(tokens > 0, "IDO: NOT ENOUGH TOKENS FOR SALE");
314         require(tokens <= _minAmount || _updateSupplyTokenIDtoPoolContract(_tokenId, _minAmount, "IDO: MIN_AMOUNT_EXCEEDED");
315         require(_updateSupplyTokenIDtoPoolContract(_tokenId, _amount) <= _poolAmount, "IDO: EXCEEDS_POOL_CAPACITY");
316
317         _updateTokenSupply(_token, _amount);
    
```

(Blurring the image of the code snippet in the public report because the Customer's code is in the private repository)

Users have to pay more gas for their requests.

Recommendation

Use 'external' instead of 'public' for functions that are only called outside of the contract.

- [IDO-pool::PreSalePool.sol](#) (#L299-L332, #L268-L297, #L363-L383)

3. CONCLUSION

This document, and its appendices, represents the results of several days of our intensive work.

Smart contracts within the scope were analyzed with static analysis tools and manually reviewed.

Please feel free to direct any questions on this assessment to: audit@securichain.io.

APPENDIX 1. ASSESSMENT LIST

CHECKLIST		
Arithmetic operations		
	Integer Overflow/Underflow	Integer Division
	Integer Truncation	Integer Sign
	Wrong Operator	
Re-entrancy		
Bad Randomness		
	Timestamp Dependence	Blockhash
Front running		
DDos		
	DOS By Complex Fallback Function	DOS By Gaslimit
	DOS By Non-existent Address Or Malicious Contract	
Unsafe external calls		
Gas usage		
	Invariants in Loop	Invariants State Variables Are Not Declared Constant
Business Logics Review		
Access Control & Authorization		
	Replay Attack	Use tx.origin For Authentication
Logic Vulnerability		

APPENDIX 2. RISK RATING

Risk Level	Explain	Example Types
High	The issue puts a large number of users' sensitive information at risk, or is reasonably likely to lead to catastrophic impact for client's reputation or serious financial implications for client and users.	<ul style="list-style-type: none"> Re-entrancy Front running DDos Bad Randomness Logic Vulnerability Arithmetic operations
Medium	The issue puts a subset of users' sensitive information at risk, would be detrimental for the client's reputation if exploited, or is reasonably likely to lead to moderate financial impact.	<ul style="list-style-type: none"> Access Control Unsafe external calls Business Logics Review Logic Vulnerability
Low	The risk is relatively small and could not be exploited on a recurring basis, or is a risk that the client has indicated is low-impact in view of the client's business circumstances.	<ul style="list-style-type: none"> Gas usage
Info	The issue does not pose an immediate risk, but is relevant to security best practices or Defence in Depth.	Do not specify a specific version of Solidity
